

MoSPI Manual: National Accounts Statistics & CPI Aggregation

Official Reference Document ID: MoSPI/NAD/2026/DOC-02

1. Consumer Price Index (CPI) Basket Construction

The Consumer Price Index measures changes over time in the general level of prices of goods and services consumed by target population groups. Items are selected based on the Consumer Expenditure Survey (CES). Items accounting for 0.1% or more of total household expenditure are included in the basket.

2. Laspeyres Price Index Formula

CPI compilation utilizes the modified Laspeyres formula, where base year quantity weights (W_0) are held constant while current period prices (P_t) are compared against base period prices (P_0). Price relatives are calculated at the primary item level across rural and urban markets.

3. Gross Domestic Product (GDP) Compilation Methods

GDP is estimated using three approaches: Output/Production Method (Gross Value Added at Basic Prices), Income Method, and Expenditure Method. Sectoral GVA for manufacturing, agriculture, and services follows the System of National Accounts (SNA 2008) guidelines.

4. Deflators and Real GDP Calculation

Nominal GVA is converted to Real GVA using appropriate price deflators (WPI and CPI). Single deflation is primarily used where double deflation data is unavailable due to input price index constraints.
